Please find below and/or attached an Office communication concerning this application or proceeding.

**Office Action Summary**

Application No.

10/732,950

Applicant(s)

CHEN ET AL.

Examiner

Lex Malsawma

Art Unit

2823

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 21 November 26, 2005.  
2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.  
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-8 is/are pending in the application.  
4a) Of the above claim(s) 7 and 8 is/are withdrawn from consideration.  
5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.  
6) ☒ Claim(s) 1-6 is/are rejected.  
7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.  
8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.  
10) ☒ The drawing(s) filed on 06 April 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).  
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☐ All b) ☐ Some \* c) ☐ None of:  
1. ☐ Certified copies of the priority documents have been received.  
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☐ Notice of References Cited (PTO-892)  
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)  
3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.  
4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date \_\_\_\_\_.  
5) ☐ Notice of Informal Patent Application (PTO-152)  
6) ☐ Other: \_\_\_\_\_.

## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on November 21, 2005 has been entered.

### ***Claim Rejections - 35 USC § 112***

2. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

3. Claims 1-6 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

The limitation added to claim 1 (by the amendment filed on November 21, 2005) is new matter that is not disclosed or suggested by the current specification. More specifically, the current specification does not disclose or make reference to majority carriers accumulated at the substrate surface, especially majority carriers accumulated without forming an inversion layer. Accordingly, the added limitation will not be addressed in this Office action and claims 1-6 are

considered to be the same as claims 1-6 presented in the previous amendment filed on May 26, 2005.

***Claim Rejections - 35 USC § 103***

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

6. Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Suzuki** (5,598,029).

*Regarding claim 1:*

Suzuki discloses a decoupling capacitor (Fig. 4), comprising:

a fixed resistance in series with said capacitor, said capacitor formed by a polysilicon layer 4 and a diffusion layer (8 and/or 9), said fixed resistance formed by contacts

(TH1a, 1b, 2a, 2b, etc.) connecting said polysilicon layer 4 to a first voltage level buss 1 (i.e., power supply line, Col. 4, lines 49-50) and said diffusion layer to a second voltage level buss 2 (i.e., ground line, Col. 4, lines 49-50);

said contacts being of location and capacity for protecting surrounding circuits in the event there is a defect shorting said busses together (i.e., note that all contacts are located “away” from the “inversion layer region” of the substrate under gate oxide 3, see Fig. 4 and Col. 5, lines 27-33; therefore, even if there is a defect in the gate oxide 3, the location of the contacts would protect surrounding circuits because any defect current must pass through the inversion layer region of the substrate where there are no contacts); and

said capacitor able to function at a frequency sufficiently high to suppress noise on said first and second busses to a value which achieves bus stability (note Col. 2, lines 10-16 and Col. 5, lines 24-33). Note that terminology such as “sufficiently high” is relative; accordingly, Suzuki’s capacitor is capable of functioning at a “sufficiently high frequency” to suppress noise, since “a sufficiently high frequency” could be any frequency that one chooses to quantify as “sufficiently high”.

Suzuki lacks specifying defect current or specifically reciting that the contacts are located and capable of limiting defect current. However, as noted above, Suzuki shows (in Fig. 4) that the contacts (TH1a, TH1b, etc.) are located away from the inversion-layer region (underneath gate oxide 3); accordingly, any defect current resulting from a defect in the gate oxide 3 must pass through the inversion-layer region of the substrate in order to short the busses (1, 2) together. Such a construction would obviously limit defect current because the inversion-layer region of the substrate would function as a “defect-current limiter”, i.e., if the contacts (e.g.,

TH1a and TH1b) were separated ONLY by the gate oxide 3, then a defect in the gate oxide could break down the gate oxide 3 such that the contacts are shorted in a manner allowing a large amount of defect current to flow; however, because Suzuki positions the contacts such that they are separated by the gate oxide 3 AND the inversion-layer region, any defect current (caused by a breakdown in gate oxide 3) would still be limited by the inversion-layer region. Therefore, it would have been obvious to one of ordinary skill in the art to modify Suzuki by specifically reciting that the contacts are of location and capacity for limiting defect current. In other words, Suzuki's capacitor provides a structure comprising contacts being located and capable of limiting defect current while suppressing noise at a "sufficiently high frequency". *Regarding claims 2-6:*

Suzuki discloses the contacts (TH1a, 1b, 2a, 2b, etc., note Fig. 4) include a first set of contacts (TH1b, TH2b) to a first voltage (ground) and a second set of contacts (TH1a, TH2a) to a second voltage (power);

a defect leakage current limiting path (e.g., note the "inversion layer" region of the substrate under gate oxide 3, i.e., note Fig. 4 and Col. 5, lines 27-33) including said first set and said second sets of contacts separated by a distance optimized (i.e., this would be any distance, since an "optimized distance" is relative to one's definition of "optimum" for a given design) to cause a defect shorting said polysilicon layer 4 to said substrate 20 to force defect current to travel from the first set of contacts (TH1b, TH2b) through a section of the substrate (i.e., the "inversion layer"), then to the polysilicon 4 through any defects (in the gate oxide 3), and then along the rest of the polysilicon layer 4 to said second set of contacts (TH1a, TH2a).

Suzuki **lacks** specifying features specified in claims 3-6, including the following: preselected minimum and maximum resistance values, preselected maximum leakage current,

preselected decoupling RC factor, total contact resistance being less than 10 % of combined sheet resistance, bandwidth limiting resistance of  $R/2$ , technology-dependent number of contacts, etc.. These features (as specified in claims 3-6) are all considered to be generalized statements that are readily attributable to Suzuki's capacitor. In other words, the limitations in the instant claims are all directed to relative terminology, where the relative terms provide no specific, quantifiable, additional structural limitations to a capacitor structure that would patentably distinguish over Suzuki's capacitor structure. For example, claim 4 recites, "*first and second sets of contacts in sufficient number to effectively achieve total contact resistance less than 10% of combined sheet resistance...*". Essentially, this claim does NOT further limit the structure of the capacitor in claim 3, which already has first and second sets of contacts. More specifically, terminology such as "*sufficient number*" and "*total contact resistance less than 10% of total sheet resistance*" can only be interpreted to mean "any number" (i.e., any number can be a "sufficient number") and "any resistance value" (i.e., since the "sheet resistance" has not been quantified and therefore could be any value, "10% of any value" is essentially "any value" that one chooses); therefore, the limitations recited in the instant claims are considered to be general statements that are readily attributed to Suzuki's capacitor structure. In sum, the instant claims are held obvious over Suzuki because Suzuki's capacitor structure contains all pertinent structural limitations necessary for one of ordinary skill in the art to attribute the generalized features recited in the instant claims.

***Remarks***

7. Applicants' remarks/arguments have been carefully reviewed and considered, but they are not persuasive. The examiner disagrees with the applicants' submission that Figure 10 provides support for the negative limitation added to claim 1 because there is no disclosure or suggestion in the specification describing how features such as majority carriers and an inversion layer would be (or would not be) essential to the current invention. Accordingly, the rejections presented above are essentially a copy of the rejections presented in the previous Office action.

With respect to applicants' remarks regarding the inversion layer (in Suzuki), it is important to note the limitation in claim 1 is directed to a structure "capable of limiting defect current", i.e., a "defect current" could not be considered as a current due to a short between the power supply (on the gate) to the grounded source/drain regions, but rather, it would be considered to be a "leakage current" between the power supply and ground (through the gate oxide). In other words, the inversion layer, even if it is highly conductive at a correct voltage, would have a maximum "conductivity" for a given FET (i.e., no properly operating FET can produce infinite current), accordingly, any defect/leakage current through the gate oxide would be limited by the "maximum conductivity" of the inversion layer. With respect to applicants' assertion that the term "sufficiently high" is qualified by the phrase "...to suppress noise...to a value that achieves bus stability", the examiner maintains that "sufficiently high" is still relative because the phrase, "a value that achieves bus stability", also recites relative terminology, i.e., a value that achieves bus stability could include a wide range of values or could be essentially any value depending on what one defines to be a stable buss. With respect to claims 2-6, the

examiner maintains that the relative terminology used in these claims cannot patentably distinguish the current claims over Suzuki.

In sum, claims 1-6 do not patentably distinguish over Suzuki because the structural elements in claims 1-6 are disclosed by Suzuki, and the only essential modification to Suzuki, necessary to arrive at the currently claimed invention, is to describe Suzuki's capacitor structure utilizing relative terminology. Therefore, claims 1-6 are deemed obvious over Suzuki.

#### ***Status of the claims***

8. Claims 1-6 are currently rejected under 35 USC § 103.
9. Claims 7-8 are withdrawn from consideration.

#### ***Conclusion***

10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Lex Malsawma whose telephone number is 571-272-1903. The examiner can normally be reached on Mon. - Thur. (4-12 hours between 5:30AM and 10 PM).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Matthew Smith can be reached on 571-272-1907. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
